→ Checked Python application for live music spectrum and notes detection.

→ Checked AI exercise-solutions-Roots etc. Problem 1-11;

→ HW: Write a function to convert a decimal value like 5.2344 to a fraction like $\frac{52344}{10000}$; Check if the value is an integer, or else keep multiplying with '10' in a loop until it becomes an integer. Take care of the sign of the value as well. Update previous HW ex-4 using this function.

→ <u>HW:</u> For Exercise 11 of finding perfect int. roots (Eg: $81 = 9^2$ or $343 = 7^3$) instead of finding only one root, find all possible roots.

Eg: (1) $81 = 9^2 = 3^4$

(2) $1024 = 2^{10} = 4^5 = 32^2$

→ <u>HW:</u> Check remaining AI exercises & remaining HWs from 05 Dec '25
