- Checked previous Hws on propositions
- wrapped up Grade 2
- If $A \propto B$ and $A \propto C$
then $A \propto B \cdot C$
(only if B and C are independent
of each other)

Eg: Let's say we are buying boxes (B) of
chocolates (C). Each B has 5C.
The total money we have to spend
 $M \propto B$

$$M \propto C$$

But $M \not\propto B \cdot C$
Why?

$$\text{If } M \propto B \cdot C$$

$$\Rightarrow M \propto 5C \cdot C$$

$$\Rightarrow M \propto 5 \cdot C^2$$

This implies if I buy 1C vs 5C

M is increasing 25 times for
5 times more chocolates. This is

not true.

B and C are not independent of
each other ($B = 5 \times C$).
